# MALMUNDERSØKELSER I KVARTSITTFORMASJONEN (KONSESJONSOMRÅDET) 1972 - 1976

Malmreservene ved de bedriften startet opp ca. 10 mill.tonn. Undersøkelsene i kvartsittserien har hatt til hensikt å finne ny malm som kunne kompensere produksjonsmengden slik at malmreservene i lengst mulig tid kunne være uendret eller i heldigste fall økende. Den nye malmtonnasjen håpet man å finne i tilknytning til de kjente forekomster eller i den nordliggende del av kvartsittserien slik at en eventuell produksjon herifra kunne skje med det eksisterende produksjonsoppleggs.

Undersøkelsene har innbefattet diamantboringer, geokjemiske og geofysiske undersøkelser. (bilag 1)

## Diamantboringer

Følgende hull er blitt boret:

Geokjemi

1 Grunnvannsprøver

Det er samlet inn 54 prøver av grunnvannet i kvartsittenområdet de kjente forekomstene. Prøvene ble analysert på Cu, og dessuten ble PH bestemt. Bilagene 3 og 4 viser prøvelokalitetene, analyseverdier, PH-resultatene samt type grunnvann.

2 Jordprøver

I et område nord for Ulveryggen (Nordområdet - Småvannene) ble det samlet inn 1250 jordprøver. Profilavstanden var 100 m, prøveavstanden var 25 - 50 m.

3 Knakk-prøver

I samme område (Nordområdet - Småvannene) ble det tatt fastfjelleprøver, vel 1100 i alt. Profil og prøveavstanden var den samme som for jordprøvene. Både knakk og jordprøvene ble analysert på Cu.

Tidligere er såvel kvartsittområdet som den nordligste del av grunnfjellsvinduet dekket med en tettere anlagt prøvetaking.

Nordområdet - Småvannene ga ved denne prøvetaking et lignende geokjemisk bilde som malmfeltet i Ulveryggen.
